

# jQuery Assignment

The purpose of the lesson is to provide a basic understanding of jQuery and its application in frontend development. In the [Required Readings](#), you were assigned to watch and follow along with a series of videos to gain actual experience writing and using jQuery. This video and the associated files are the basis of the jQuery assignment.

## Requirements

- ☐ Store all your tutorial work in a ***lesson-11*** folder within the *assignments* folder.
- ☐ **Complete the tutorial** by watching and following along with your own files locally. You will not be expected to retain all of the work completed in the examples shown in the Alcove page. Just complete each tutorial in lessons 1 through 4.
- ☐ **Modify** all folder names if necessary to **match web naming rules** and your preferences. Some of the author's folder and files do not comply. In addition, you may consider using semantic elements versus the author's `<div id="header">` approach for example.
- ☐ **Comment out** the script tags in all HTML pages that refer to a local copy of the jQuery library.
- ☐ **Create** a script tag that uses an external source for the jQuery library.
- ☐ **Create** links to the other pages in the tutorial folder in the footer of the lesson's home page (index.htm file). In the end, there are a total of five page links to be added in the footer.

## Assessment

- Upload the finished files and folders to your remote site and submit your GitHub Pages URL to the [assignment](#) drop-box.

<b>Assessment Criteria</b> 20 points possible: Concept Application Category
The folder name has been modified and all folders and files meet web naming standards.
The pages reference an external jQuery library source through a viable CDN.
Each web page will be checked for completed operation according to the finished behavior shown in the tutorial videos.
